For me to prepare, I must research common interview questions that are asked for software engineering. Also, I will have to freshen up on programming languages. I am qualified in understanding how algorithm works. However, I need to learn other programming languages.

The way to learn is reading textbooks online. This will help me freshen up my memory in skills and learn new things that may be asked in the interview. Moreover, I will watch videos that talk about experiences in interviews. Practicing coding using new languages will help me further understand different ways to tackle a problem in the tech world. I will have to see ways in how designing and ML infrastructures work since that is one of the requirements for the job. Researching the job, the position and refreshing your memory is important when pursuing a job that has competition. I have learned this during my years of working in different areas in the food industry. Although I might not get the job, I at least learned a few things to pursue a different job listing.
